Maintainable, but explains almost none of the lost diversity
Neither maintainable nor enough to explain the lost diversity
Could explain the lost diversity, far from maintainable
no single c: 389-fold gap
Long-run V_A as a multiple of the pedigree estimate, $c = \overline{V}_A / \hat{V}_A$
$\overline{V}_A / U_d \overline{s}$: long-run V_A ÷ the V_A mutation–selection balance maintains
$(N_e/N)_{pred}/\delta$: predicted ÷ observed diversity, multiplicative upper bound
the same at first order, $1/(1+4\kappa\overline{V}_A)$, while $\overline{V}_A \leq 1$
