
Multiplicative bound: $V_{A,\delta} = \frac{\ln(1/\delta)}{4\kappa_{max}}$
the least variance that could explain δ;
upper line random mating,
lower strict monogamy
with linkage, per mapped population: the least variance
that could explain δ at its assigned empirical DFE
Small-variance approximation: $V_{A,max} = \frac{1-\delta}{4\kappa\delta}$
drawn where it holds, ceiling ≤ 1 (δ ≥ 0.11–0.2);
band κ = 1 to 2
Additive genetic variance in relative fitness, V_A
