
All orders: $V_{A,max} = \frac{\ln(1/\delta)}{4\kappa(0)}$
from the upper bound on the reduction: the least variance that could explain δ; upper line no pair bond, lower pair bond
with linkage, per mapped population: the least variance that could explain δ at the most generous measured DFE
First order: $V_{A,max} = \frac{1-\delta}{4\kappa\delta}$
drawn inside its domain, ceiling ≤ 1 (δ ≥ 0.11–0.2); band κ = 1 to 2
Additive genetic variance in relative fitness, V_A
Observed diversity relative to its neutral expectation, $\delta = \pi/4\mu N_c$
