46–5,100× at the domain edge
Maintainable, but explains almost none of the lost diversity
Not maintainable, explains little
Outside the model's domain:
long-run $V_A > 1$
Long-run V_A as a multiple of the pedigree estimate, $c = \overline{V}_A / \hat{V}_A$
$\overline{V}_A / U_d s$: long-run V_A ÷ the V_A mutation–selection balance maintains
$\delta^{-1} / (1 + 4\kappa \overline{V}_A)$: observed ÷ predicted loss of diversity
the same with $G = 1 - \overline{V}_A$ (selection depletes the variance it acts on)
